Summary : Free exposure of the american population to
radioactive fallout from nuclear weapons tests pdf download -
this report is a review of the draft feasibility study that was
issued at the request of congress by the centers for disease
control and prevention cdc and the national cancer institute nci
over 500 atmospheric nuclear-weapons tests were conducted at
various sites around the world during 1945-1980 as public
awareness and concern mounted over the possible health
hazards associated with exposure to the fallout from weapons
testing a feasibility study was initiated by cdc and nci to assess
the extent of the hazard the cdc-nci study claims that the fallout
might have led to approximately 11 000 excess deaths most
caused by thyroid cancer linked to exposure to iodine-131 the
committee noted that cdc and nci used the best available data
to estimate exposure and health hazards the committee does
not recommend an expanded study of exposure to
radionuclides other than 131i since radiation doses from those
radionuclides were much lower than those from 131i it also
recommended that cdc urge congress to prohibit the destruction
of all remaining records relevant to fallout
